

Approaches to Manage Temperature Problems

Peter Leinenbach – USEPA

Why temperature?

Salmonids - CWA (TMDL) / ESA

Questions to Ask -

- Source Assessment ("Why")
- Management Actions ("What if")
- Evaluate Management ("What")

These issues are addressed through data collection and analysis

Data Needs to Address these Questions

Stream Water Temperature - Defined

Stream Heating Processes

$$\Delta T_w \propto \frac{\Delta \text{Heat Energy}}{\text{Volume}}$$

Stream Water Temperature - Defined

Stream Heating Processes

$$\Delta T_w \propto \frac{\Delta \text{Heat Energy}}{\text{Volume}}$$

Stream Processes that Involve the Transfer of Heat Energy

Net Heat Energy Continuity

$$\Phi_{\text{total}} = \Phi_{\text{solar}} + \Phi_{\text{longwave}} + \Phi_{\text{convection}} + \Phi_{\text{evaporation}} + \Phi_{\text{streambed}} + \Phi_{\text{groundwater}}$$

Stream Water Temperature - Defined

Stream Heating Processes

$$\Delta T_w \propto \frac{\Delta \text{Heat Energy}}{\text{Volume}}$$

Evaluate Patterns

Evaluate Patterns

Summary

- Utilize Local Knowledge
- Evaluate at both Local and Watershed Scales
- Utilize Holistic Approach
 - Flow/Shade/Channel
 - Spatial Patterns

Impacts of Dams on Flowing Rivers

- Stratification - warm surface, cold bottom
- Inundation of local cold water refugia
- Flow augmentation/depletion
 - Effects vary, including
 - cooling effect from Dworshak cold water augmentation
 - warming of diel peak temperature due to White River/Lake Tapps bypass
- Temporal shift in seasonal temperatures
 - Subject of TMDL and FERC studies for a number of rivers, including Columbia, Snake, Willamette, and Deschutes

Example of Temporal Shift in Seasonal Temperature

Monitoring Considerations

- Assessing diversion effects
 - Need flow/temperature data above dam and at base of bypass reach at a minimum
- Assessing temporal shift using measurements
 - Comparing apples to apples – mixed temps
 - set upstream station in free-flowing reach
 - set downstream station in tailrace to obtain a mixed temp for comparison to upstream flowing reach
 - need full year of continuous data to assess shift

Commonly Used Models to Evaluate Dam Effects

- **CE-QUAL-W2** (most commonly used in Northwest)
 - Developed by Portland State and Army COE
 - 2D (laterally averaged temperature at a given depth)
 - Includes effects of density and outlet structures on release temps
- **RBM10 and MASS1**
 - Developed by EPA Region 10 and Batelle, respectively
 - 1D (cross sectional average temperature)
 - Used for analysis of Columbia and Snake mainstems
- **EFDC**
 - Developed by EPA contractors (Tetra Tech)
 - 3D (estimates lateral and vertical variation)
 - Used for small scale questions (e.g., confluences, near-dam effects)
